**LAB REPORT**  
**on**  
**Object Oriented Java Programming**  
**(23CS3PCOOJ)**

*Submitted by*

Annas Sharieff (**1BM23CS041**)

*in partial fulfillment for the award of the degree of*  
**BACHELOR OF ENGINEERING**  
*in*  
**COMPUTER SCIENCE AND ENGINEERING**

## B.M.S. COLLEGE OF ENGINEERING

(Autonomous Institution under VTU)

**BENGALURU-560019**

**Sep-2024 to Jan-2025**

### **B.M.S. College of Engineering,**

**Bull Temple Road, Bangalore 560019**

(Affiliated To Visvesvaraya Technological University, Belgaum)

### **Department of Computer Science and Engineering**

### **CERTIFICATE**

This is to certify that the Lab work entitled “Object Oriented Java Programming (23CS3PCOOJ)” carried out by **Annas Sharieff (1BM23CS041)**, who is bonafide student of **B.M.S. College of Engineering**. It is in partial fulfillment for the award of **Bachelor of Engineering in Computer Science and Engineering** of the Visvesvaraya Technological University, Belgaum. The Lab report has been approved as it satisfies the academic requirements in respect of an Object Oriented Java Programming (23CS3PCOOJ) work prescribed for the said degree.

## Program 1

Implement Quadratic Equation

Algorithm:

```

    } else if (discriminant() == 0) {
        r1 = -b / (c2 * a);
        system.out.println("The roots are equal");
        system.out.println("The root is:");
        r1;
    } else if (discriminant() < 0) {
        r1 = -b / (c2 * a);
        r2 = (-b + Math.sqrt(-discriminant())) /
            (double)(c2 * a);
        system.out.println("The roots are imaginary");
        system.out.println("First root: " + r1);
        system.out.println("Second root: " + r1);
        - i + r2);
    }
}

```

```

class Run {
    public static void main(String[] args) {
        quadratic eq1 = new quadratic();
        eq1.compute();
        quadratic eq2 = new quadratic();
        eq2.compute();
        quadratic eq3 = new quadratic();
        eq3.compute();
    }
}

```

Output :

Enter a, b and c from quadratic equation :

Enter a, b and c from quadratic equation:

1

2

1

The roots are equal

The root is: -1.0

Enter a, b and c from quadratic equation:

3

4

9

The roots are Imaginary

First root: 0.0+i0.9319438411042397

Second root: 0.0-i0.9319438411042397

Enter a, b and c from quadratic equation:

1

5

6

The roots are unique

First root: -2.0

Second root: -3.0

## Program 2- SGPA Calculator :

Algorithm:

The image shows a handwritten algorithm for a SGPA Calculator in a notebook. The algorithm is written in Java-like pseudocode. It starts with importing the Scanner class, defining a Subject class with subjectMarks, credits, and grade attributes, and a calculateGrade method. The calculateGrade method uses nested if statements to determine the grade based on subjectMarks. The conditions for grades 10, 9, 8, 7, 6, and 5 are defined with their respective marks. There is a red mark with 'NGO' and '50' crossed out above the condition for grade 6.

```
q. student details, SGPA .
import java.util.Scanner ;
class Subject {
    int subjectMarks ;
    int credits ;
    int grade ;
    public void calculateGrade() {
        if (subjectMarks >= 90 && subjectMarks <= 100) {
            grade = 10 ;
        } else if (subjectMarks >= 80) {
            grade = 9 ;
        } else if (subjectMarks >= 70) {
            grade = 8 ;
        } else if (subjectMarks >= 60) {
            grade = 7 ;
        } else if (subjectMarks >= 50) {
            grade = 6 ;
        } else if (subjectMarks >= 40) {
            grade = 5 ;
        }
    }
}
```

```
else S  
grade = 0 ;
```

## Program 8- Multithreading:

Algorithm:

The image shows handwritten code in a notebook, divided into two pages by a vertical red margin line. The left page contains code for the BMS class, and the right page contains code for the CSE class. Both classes extend the Thread class and implement the run() method. The BMS class uses a sleep of 1000 ms, while the CSE class uses a sleep of 2000 ms. Both classes catch InterruptedException. The main() method creates instances of BMS and CSE and starts them. The output section shows the alternating prints of "BMS College of Engineering" and "CSE".

DATE PAGE

class BMS extends Thread {  
 public void run() {  
 try {  
 while (true) {  
 System.out.println ("BMS College of  
Engineering");  
 Thread.sleep (1000);  
 }  
 } catch (InterruptedException e) {}  
 }  
}

public class Multithreading {  
 public static void main (String [] args) {  
 BMS bms = new BMS ();  
 CSE cse = new CSE ();  
 bms.start ();  
 cse.start ();  
 }  
}

Output

BMS College of Engineering  
CSE  
CSE  
CSE  
CSE  
BMS College of Engineering

DATE PAGE

class CSE extends Thread {  
 public void run() {  
 try {  
 while (true) {  
 System.out.println ("CSE");  
 Thread.sleep (2000);  
 }  
 } catch (InterruptedException e) {}  
 }  
}

## Code:

The screenshot shows a Java code editor window titled "Multithreading.java". The menu bar includes "File", "Edit", and "View". The code defines two thread classes, BMS and CSE, which extend the Thread class. Both classes implement a run() method that prints their respective college names and sleeps for a specified duration. A main() method creates instances of BMS and CSE and starts them. The code is signed off by "Annas Sharieff 1bm23cs041".

```
class BMS extends Thread {
    public void run() {
        try {
            while (true) {
                System.out.println("BMS College of Engineering");
                Thread.sleep(10000);
            }
        }catch (InterruptedException e) {}
    }
}
class CSE extends Thread {
    public void run() {
        try {
            while (true) {
                System.out.println("CSE");
                Thread.sleep(2000);
            }
        }catch (InterruptedException e) {}
    }
}

public class Multithreading{
    public static void main(String[] args) {
        BMS bms = new BMS();
        CSE cse = new CSE();
        bms.start();
        cse.start();
    }
}
